Why Are Fire Doors Important?

Fire doors are an essential component of fire safety within buildings. These will be part of any inspection carried out on a building and represent an important control measure from a suitable and sufficient fire risk assessment.

A correctly installed fire door and frame will delay deadly smoke, fumes and flames from spreading within a building for usually 30 minutes to an hour which will give occupants of the building valuable time to escape.

Why Do I Need Them Inspected?

The principle legislation covering fire safety, The Regulatory Reform (Fire Safety) Order 2005 (RR0/FSO) states that any fire-resisting doors and escape doors must be correctly installed and adequately maintained in order for them to be fit for purpose. It is advised in BS9999 that all fire doors are inspected every 6 months.

If, after a fire, it is found that you haven't met your legal duties, you could be fined or even imprisoned as a result.

What do OHEAP offer?

Inspections

Our team will carry out thorough inspections, where we will identify any issues with the door leaf, door frame, furniture and surrounding elements.

Repairs

After we've carried out our inspection, we will give you a complete, no obligation, report of our findings with a breakdown of what needs to be done. If you are happy to proceed we will then carry out any repairs or replacements all of which will comply to appropriate British and International Standards.

Supply & Install

We can supply brand new BWF-certified fire doors in a range of sizes, styles and finishes to suit your property and our certified Fire Door Engineers at OHEAP can also install these throughout your property.
